

Food & Pharma

Safety and hygiene are very important in the pharmaceutical and food industries. BRAND®'s industry knowledge and experience help establish the compliance parameters that will govern our procedures, and choice of materials and tools for safe and hygienic plant installation, maintenance, review or repair.

Before maintenance projects can start, precautions have to be taken - machines and production lines must be physically shielded to prevent contamination or parts and materials getting into the production process. All our materials and equipment, including scaffolds, are specially cleaned before delivery and installation, and all our technicians wear protective clothing while on site, such as dust-free overalls, masks and overshoes. Air-flows, work-flows and waste-flows are also considered in an effort to reduce the impact on the working environment.

The pharmaceutical industry's requirements in terms of hygiene are often more stringent than in the food industry. Mechanics, materials and tools must meet cleanroom conditions and we have specific knowledge and experience in this area. The work environment where maintenance is performed is kept under

pressure to prevent dust expansion and contagion during the production process.

One of the food-industry's key requirements is that dust formation must be prevented during insulation work. To comply with this, all our insulation and cladding is as far as possible pre-fabricated, and only non dust-forming materials are specified.

**more safety
more productivity**
