

# Manufacturing & Processing

**Process plants around the world share a common requirement for safe and efficient access to facilitate construction and ongoing fabric maintenance. BRAND® has extensive experience in construction, turnarounds and modernization of tanks, providing our access and insulation services to clients as a tank terminals total package.**

Logistical preparation is essential for the construction of tanks. Turnaround times are short and the space at production sites is often limited. Moreover, tanks are often different diameters, and they vary in height. We build scaffolding on the outside of the tanks to a great height and have the expertise for the safe installation of interior scaffolding - planning access and insulation work and the delivery of tanks to be tightly coordinated.

For tank terminals, we offer special tank scaffolding for safe, fast access. And for specific activities such as blasting and painting of new tanks, we develop special solutions to make workplaces accessible and sealed. The space between tanks on a tank farm is often limited. We use specific logistic resources if no forklifts, cranes and ladder trucks can be used. These resources are developed based on our extensive experience in tank terminals.

For our employees working at tank terminals where the transfer of several Hazardous Substances occurs, safety is imperative. All technicians follow strict procedures and work instructions.

Our belief in the value of planning-based maintenance has led us to develop a complete range of specialist services.

**more safety  
more productivity**
